

Converting within the metric system

* metric units can be in standard form:

ex. length \rightarrow metre (m)
mass \rightarrow gram (g) } table 4.4 pg 48

- if numbers are very small or large, prefixes are used.

ex. Kilo (k) } table 4.5 pg 48
centi (c)

Kilo means $10^3 = 1000$: there are 1000L in a KL
there are 0.001KL in a L

centi means $10^{-2} = 0.01$: there are 0.01g in a cg
there are 100cg in a g

mega means $10^6 = 1000000$: there are 1000000g in a mg
there are 0.000001mg in a g

Conversion Factors:

$$5\text{km} = \underline{\hspace{2cm}} \text{m}$$

$$5\text{km} \times \frac{1000\text{m}}{1\text{km}} = 5000\text{m}$$

$$\frac{1000\text{m}}{1\text{km}} \quad \frac{1\text{km}}{1000\text{m}}$$

Choose this one b/c we want bottom km units to cancel.

$$1583\text{g} = \underline{\hspace{2cm}} \text{cg}$$

$$1583\text{g} \times \frac{100\text{cg}}{1\text{g}} = 158300\text{cg}$$

Molar Volume of Gases

Properties of Gases

Brainstorm: scuba tanks (O_2), pressure systems (CO_2), propane

1. → gases have no fixed volume, they fill their container.
2. → gases are compressible & when pressure is applied, volume decreases.
3. → gases diffuse rapidly and mix with other gases.

* Temperature & Pressure both affect the volume of a gas.

↑ temperature = ↑ volume ex. hot air balloon
= ↑ pressure

↑ pressure = ↓ volume

Pressure is a measure of force per unit area.

- measured in (kPa)

$$1 \text{ kPa} = \frac{1000 \text{ N}}{1 \text{ m}^2} = \frac{100 \text{ Kg}}{1 \text{ m}^2 \text{ (on earth)}} = \frac{220 \text{ lbs}}{1 \text{ m}^2 \text{ (on earth)}}$$

Temperature = °C

Volume = L

→ the atmosphere places 101 kPa of pressure on our bodies.

* Gases can be considered at...

1) Standard Temperature and Pressure (STP)

0°C, 101.325 kPa

2) Standard Ambient Temperature and Pressure (SATP)

25°C, 101 kPa

BOYLE'S LAW

- Boyle found that by increasing pressure on a gas, the volume decreases proportionally.
Doubling the pressure decreases volume by $\frac{1}{2}$.
- assume temperature is constant.

$$P_1 V_1 = P_2 V_2 \quad \text{Boyle's Law}$$

ex. 3L of gas at 101 kPa has its pressure tripled.
What is the new volume?

$$\begin{aligned} P_1 V_1 &= P_2 V_2 \\ (\cancel{101 \text{ kPa}})(3\text{L}) &= (\cancel{303 \text{ kPa}})(V_2) \\ 303 \text{ kPa} &= 303 \text{ kPa} \\ 1 \text{ L} &= V_2 \end{aligned}$$

ex. A pump contains 1.5L of air at 101 kPa. What pressure needs to be applied to change the volume to 0.5L?

$$\begin{aligned} P_1 V_1 &= P_2 V_2 \\ (\cancel{101 \text{ kPa}})(\cancel{1.5 \text{ L}}) &= (P_2)(\cancel{0.5 \text{ L}}) \\ 0.5 \text{ L} &= P_2 \\ 303 \text{ kPa} &= P_2 \end{aligned}$$

ex. If a 1L helium balloon is purchased in Vancouver, BC, where atmospheric pressure is 101 kPa, then transported to Banff, Alberta, where atmospheric pressure is 93 kPa.

a) why is atmospheric pressure lower in Banff than in Vancouver?
banff is at a higher elevation ∴ less atmospheric pressure.

b) what would be the new volume of the helium balloon?
(assume temperatures are the same in both locations)

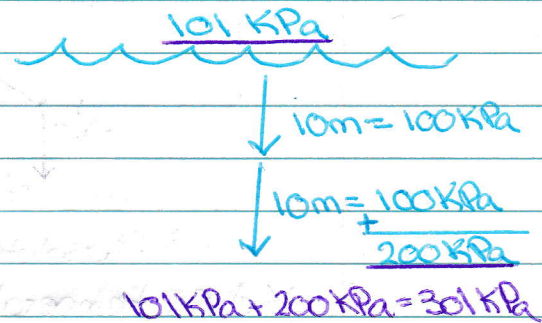

$$\begin{aligned} (\cancel{101 \text{ kPa}})(1\text{L}) &= (\cancel{93 \text{ kPa}})(V_2) \\ 93 \text{ kPa} &= 93 \text{ kPa} \\ 1.09 \text{ L} &= V_2 \end{aligned}$$

ex. When diving underwater, pressures increase by 100 kPa for every 10m of depth on top of atmospheric pressure (101 kPa). If a diver at 20m of depth holds 4L of air in their lungs and is shot suddenly to the surface, what would be the new volume of air in the divers lungs? Why is it dangerous to surface quickly when diving?
